

NAME

latex, pdflatex, lualatex, dvilualatex, xelatex, lamed – structured text formatting and typesetting

SYNOPSIS

latex [*first-line*]

DESCRIPTION

This manual page is not meant to be exhaustive. The complete documentation for this version of T_EX can be found in the info file or manual *Web2C: A TeX implementation*.

The L^AT_EX language is described in the book L^AT_EX – *A Document Preparation System*. L^AT_EX is a T_EX macro package, not a modification to the T_EX source program, so all the capabilities described in **tex**(1) are present.

The L^AT_EX macros encourage writers to think about the content of their documents, rather than the form. The ideal, very difficult to realize, is to have no formatting commands (like “switch to italic” or “skip 2 picas”) in the document at all; instead, everything is done by specific markup instructions: “emphasize”, “start a section”.

The primary source of documentation for L^AT_EX is the L^AT_EX manual referenced below, and the local guide in the file *local-guide.tex* or *local.tex* or some such.

pdflatex, **lualatex**, and **xelatex**, are L^AT_EX formats based on the respective engines. All output PDF by default.

lamed is the Aleph-based L^AT_EX format (DVI output).

On some systems **latex209** and **slitex** are available for compatibility with older versions of L^AT_EX. These should not be used for new texts.
